I changed the layout on the home page from a grid to a simple scroll down because I feel like it can be overwhelming for the user to be bombarded with so many options especially on the first page. Instead, a scroll format can easily let the user know the chronological order of certain topics.

Below is the before and after of the first page design.

Before

After

I also removed the "read more" from the home page and made it so that the hyperlinks are the title themselves because I felt that the "read more" text was unnecessary. With the new design, the user can

click the subtitle of the topic and it will have the same function as the read more hyperlink from the old design. This in a way provides a more intuitive experience for the user.
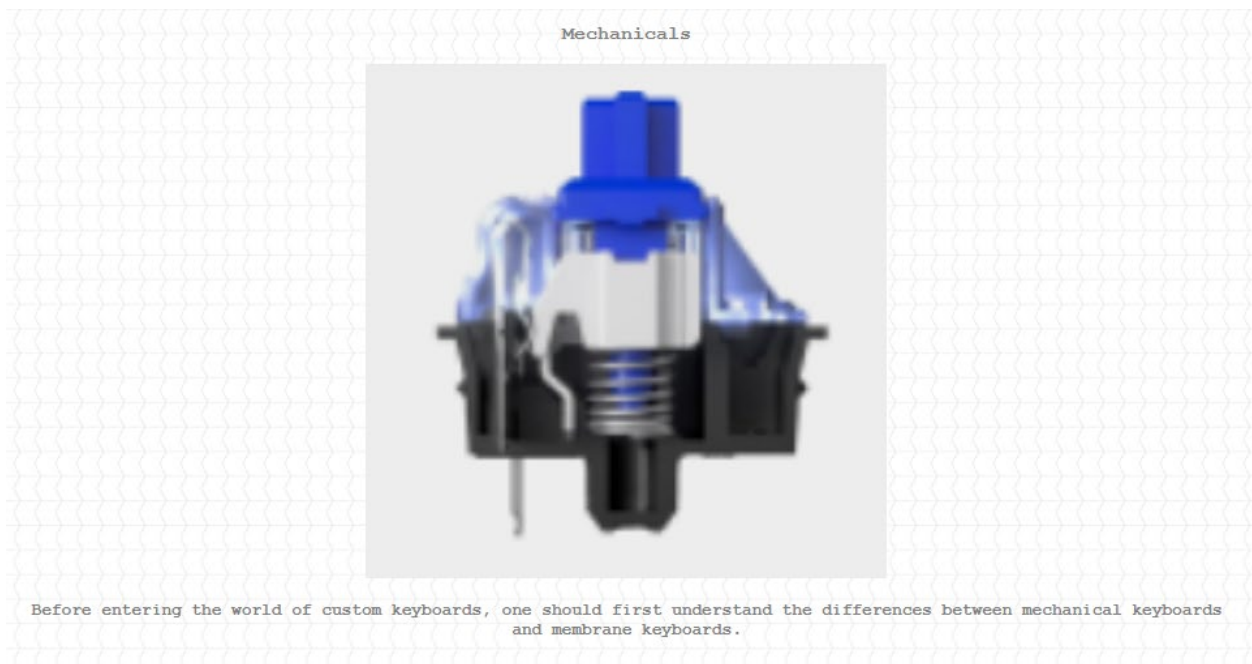

Before

Mechanicals

Before entering the world of custom keyboards, one should first understand the differences between mechanical keyboards and membrane keyboards.

After

Mechanicals

Before entering the world of custom keyboards, one should first understand the differences between mechanical keyboards and membrane keyboards.

I also changed the design for the navigation bar to a more modern look. This includes adding a background colour for the nav bar and when the user hovers over the text, the background colour changes from grey to black.

Before

After

Lastly, I added a subtle background with a repeating pattern to complete the look of my website. The overall design of the website is a simple monotone black and white design. All links are extremely intuitive for the user and I would say that the website is about 80% done as there is not much more to be added.
